Probability: Common Distributions

 \blacksquare **Bernoulli** (Ber(p)): A weighted coin flip

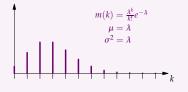

Binomial (Bin(n, p)): A sum of n independent Ber(p)'s

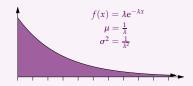

3 Geometric (Geom(p)): Time to first success (1) in a sequence of independent Ber(p)'s

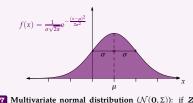

4 Poisson distribution (Poiss(λ)): Limit as $n \to \infty$ of Binomial $(n, \frac{\lambda}{n})$

S Exponential distribution (Exp(λ)): Limit as $n \to \infty$ of distribution of 1/n times a Geometric(λ/n)

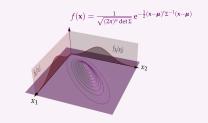

6 Normal distribution $(\mathcal{N}(\mu,\sigma^2))$: Limit as $n\to\infty$ of the distribution of $\frac{X_1+X_2+\cdots+X_n}{\sqrt{n}}$, for any independent sequence X_1,\ldots,X_n of identically distributed random variables (i.i.d.) with $\mathbb{E}[X_1]=\mu$ and $\mathrm{Var}(X_1)=\sigma^2<\infty$ (see Central Limit Theorem).

? Multivariate normal distribution $(\mathcal{N}(0,\Sigma))$: if $Z=(Z_1,Z_2,\ldots,Z_n)$ is a vector of independent $\mathcal{N}(0,1)$'s, A is an $m\times n$ matrix of constants, and $\mu\in\mathbb{R}^m$, then the vector

$$X = AZ + \mu$$

is **multivariate normal**. The covariance matrix of \mathbf{X} is $\Sigma = AA'$.

Machine Learning

1 The KDE cross-validation loss estimator is

$$J(f) = \int_{\mathbb{R}} \widehat{f}_{\lambda}^2 - \frac{2}{n} \sum_{i=1}^n \widehat{f}_{\lambda}^{(-i)}(X_i),$$

2 The logistic regression loss estimator is

$$L(r) = \sum_{i=1}^{n} \left[y_i \log \frac{1}{r(x_i)} + (1-y_i) \log \frac{1}{1-r(x_i)} \right],$$

3 The SVM loss estimator is

$$L(\boldsymbol{\beta}, \alpha) = \lambda |\boldsymbol{\beta}|^2 + \frac{1}{n} \sum_{i=1}^{n} [1 - y_i(\boldsymbol{\beta} \cdot \mathbf{x}_i - \alpha)]_+$$

Data Wrangling with dplyr and tidyr

Cheat Sheet

Syntax - Helpful conventions for wrangling

dplyr::tbl df(iris)

Converts data to tbl class. tbl's are easier to examine than data frames. R displays only the data that fits onscreen:

Source: local data f	rame [150 x	5]
Sepal.Length Sepa 1 5.1 2 4.9 3 4.7 4 4.6 5 5.0	l.Width Peta 3.5 3.0 3.2 3.1 3.6	l.Length 1.4 1.4 1.3 1.5
Variables not shown: Species (fctr)	Petal.Width	(dbl),

dplyr::glimpse(iris)

Information dense summary of tbl data.

utils::View(iris)

View data set in spreadsheet-like display (note capital V).

	iris ×				
\(\(\)	↓ ⇒ Æ ▼ Filter Q				
	Sepal.Length [‡]	Sepal.Width [‡]	Petal.Length [‡]	Petal.Width [‡]	Species [‡]
1	5.1	3.5	1.4	0.2	setosa
2	4.9	3.0	1.4	0.2	setosa
3	4.7	3.2	1.3	0.2	setosa
4	4.6	3.1	1.5	0.2	setosa
5	5.0	3.6	1.4	0.2	setosa
6	5.4	3.9	1.7	0.4	setosa
7	4.6	3.4	1.4	0.3	setosa
8	5.0	3.4	1.5	0.2	setosa

dplvr::%>%

Passes object on left hand side as first argument (or . argument) of function on righthand side.

"Piping" with %>% makes code more readable, e.g.

Tidy Data - A foundation for wrangling in R

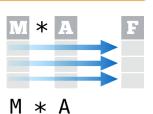

In a tidv data set:

Each **observation** is saved in its own row Tidy data complements R's vectorized **operations**. R will automatically preserve observations as you manipulate variables. No other format works as intuitively with R.

Reshaping Data - Change the layout of a data set

in its own **column**

tidyr::gather(cases, "year", "n", 2:4)

Gather columns into rows.

tidyr::separate(storms, date, c("y", "m", "d"))

Separate one column into several.

tidyr::spread(pollution, size, amount)

Spread rows into columns.

tidyr::unite(data, col, ..., sep)

Unite several columns into one.

dplyr::data frame(a = 1:3, b = 4:6)

Combine vectors into data frame (optimized).

dplyr::arrange(mtcars, mpg)

Order rows by values of a column (low to high).

dplyr::arrange(mtcars, desc(mpg))

Order rows by values of a column (high to low).

dplyr::rename(tb, y = year)

Rename the columns of a data

Subset Observations (Rows)

dplyr::filter(iris, Sepal.Length > 7)

Extract rows that meet logical criteria.

dplyr::distinct(iris)

Remove duplicate rows.

dplyr::sample_frac(iris, 0.5, replace = TRUE)

Randomly select fraction of rows.

dplyr::sample_n(iris, 10, replace = TRUE)

Randomly select n rows.

dplyr::slice(iris, 10:15)

Select rows by position.

dplyr::top_n(storms, 2, date)

Select and order top n entries (by group if grouped data).

	Logic in R - ?(Comparison, ?base	::Logic
<	Less than	!=	Not equal to
>	Greater than	%in%	Group membership
==	Equal to	is.na	Is NA
<=	Less than or equal to	!is.na	Is not NA
>=	Greater than or equal to	&, ,!,xor,any,all	Boolean operators

Subset Variables (Columns)

dplyr::select(iris, Sepal.Width, Petal.Length, Species)

Select columns by name or helper function.

Helper functions for select -? select

select(iris, contains("."))

Select columns whose name contains a character string.

select(iris, ends_with("Length"))

Select columns whose name ends with a character string.

select(iris, everything())

Select every column.

select(iris, matches(".t."))

Select columns whose name matches a regular expression.

select(iris, num_range("x", 1:5))

Select columns named x1, x2, x3, x4, x5.

select(iris, one_of(c("Species", "Genus")))

Select columns whose names are in a group of names.

select(iris, starts_with("Sepal"))

Select columns whose name starts with a character string.

select(iris, Sepal.Length:Petal.Width)

Select all columns between Sepal.Length and Petal.Width (inclusive).

select(iris, -Species)

Select all columns except Species.

Summarise Data

dplyr::summarise(iris, avg = mean(Sepal.Length))

Summarise data into single row of values.

dplyr::summarise_each(iris, funs(mean))

Apply summary function to each column.

dplyr::count(iris, Species, wt = Sepal.Length)

Count number of rows with each unique value of variable (with or without weights).

Summarise uses **summary functions**, functions that take a vector of values and return a single value, such as:

dplyr::first

First value of a vector.

dplyr::last

Last value of a vector.

dplyr::nth

Nth value of a vector.

dplyr::n

of values in a vector.

dplyr::n_distinct

of distinct values in a vector.

IQR

IQR of a vector.

min

Minimum value in a vector.

max

Maximum value in a vector.

mean

Mean value of a vector.

median

Median value of a vector.

var

Variance of a vector.

sd

Standard deviation of a vector.

Group Data

dplyr::group_by(iris, Species)

Group data into rows with the same value of Species.

dplyr::ungroup(iris)

Remove grouping information from data frame.

iris %>% group_by(Species) %>% summarise(...)

Compute separate summary row for each group.

Make New Variables

dplyr::mutate(iris, sepal = Sepal.Length + Sepal. Width)

Compute and append one or more new columns.

dplyr::mutate_each(iris, funs(min_rank))

Apply window function to each column.

dplyr::transmute(iris, sepal = Sepal.Length + Sepal. Width)

Compute one or more new columns. Drop original columns.

Mutate uses **window functions**, functions that take a vector of values and return another vector of values, such as:

dplyr::lead

Copy with values shifted by 1.

dplyr::lag

Copy with values lagged by 1.

dplyr::dense_rank

Ranks with no gaps.

dplyr::min_rank

Ranks. Ties get min rank.

dplyr::percent_rank

Ranks rescaled to [0, 1].

dplyr::row_number

Ranks. Ties got to first value.

dplyr::ntile

Bin vector into n buckets.

dplyr::between

Are values between a and b?

dplyr::cume_dist

Cumulative distribution.

dplyr::cumall

Cumulative **all**

dplyr::cumany

Cumulative **any**

dplyr::cummean

Cumulative **mean**

cumsum

Cumulative **sum**

cummax

Cumulative **max**

cummin

Cumulative **min**

cumprod

Cumulative **prod**

pmax

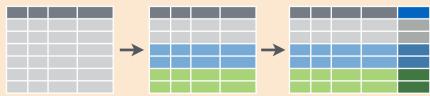

Element-wise **max**

pmin

Element-wise **min**

iris %>% group_by(Species) %>% mutate(...)

Compute new variables by group.

Combine Data Sets

Mutating Joins

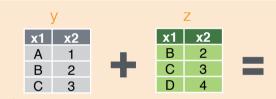

x1	x2	x3	<pre>dplyr::full_join(a, b, by = "x1")</pre>
Α	1	Т	aptytitiant_joint(a, b, b)
В	2	F	Join data. Retain all values, all rows.
С	2	NA	John data. Netam all values, all rows.
D	NA	Т	

Filtering Joins

x1 x2	<pre>dplyr::semi_join(a, b, by = "x1")</pre>
A 1 B 2	All rows in a that have a match in b.
x1 x2 C 3	<pre>dplyr::anti_join(a, b, by = "x1")</pre>
C 3	All rows in a that do not have a match in

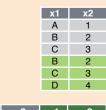

Set Operations

x1 B C	x2 2 3	dplyr::intersect(y, z) Rows that appear in both y and z.
x1 A B	x2 1	dplyr::union(y, z)
С	3	Rows that appear in either or both y and z.

x1 x2 dplyr::setdiff(y, z)

Rows that appear in y but not z.

Binding

3 D

dplyr::bind_rows(y, z)

Append z to y as new rows.

dplyr::bind_cols(y, z) B 2 Append z to y as new columns.

Caution: matches rows by position.

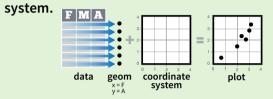

Data Visualization with ggplot2

Cheat Sheet

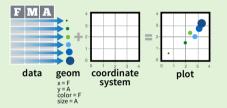

Basics

ggplot2 is based on the grammar of graphics, the idea that you can build every graph from the same few components: a data set, a set of geoms—visual marks that represent data points, and a coordinate

To display data values, map variables in the data set to aesthetic properties of the geom like size, color, and **x** and **y** locations.

Build a graph with **qplot()** or **ggplot()**

qplot(x = cty, y = hwy, color = cyl, data = mpg, geom = "point") Creates a complete plot with given data, geom, and mappings. Supplies many useful defaults.

ggplot(data = mpg, aes(x = cty, y = hwy))

Begins a plot that you finish by adding layers to. No defaults, but provides more control than qplot().

ggplot(mpg, aes(hwy, cty)) + geom_point(aes(color = cyl)) + geom smooth(method ="lm") + coord_cartesian() + scale_color_gradient() +

add layers, lements with

additional

Add a new layer to a plot with a **geom_*()** or **stat_*()** function. Each provides a geom, a set of aesthetic mappings, and a default stat and position adjustment.

last_plot()

theme bw()

Returns the last plot

ggsave("plot.png", width = 5, height = 5)

Saves last plot as 5' x 5' file named "plot.png" in working directory. Matches file type to file extension. Geoms - Use a geom to represent data points, use the geom's aesthetic properties to represent variables. Each function returns a layer.

One Variable

Continuous

a <- ggplot(mpg, aes(hwy))

a + geom area(stat = "bin")

x, y, alpha, color, fill, linetype, size b + geom_area(aes(y = ..density..), stat = "bin")

a + geom_density(kernel = "gaussian") x, y, alpha, color, fill, linetype, size, weight

b + geom density(aes(y = ..county..))

a + geom_dotplot()

a + geom_freqpoly()

x, y, alpha, color, linetype, size b + geom freqpoly(aes(y = ..density..))

a + geom histogram(binwidth = 5)

x, y, alpha, color, fill, linetype, size, weight b + geom_histogram(aes(y = ..density..))

Discrete

b <- ggplot(mpg, aes(fl))

b + geom bar()

x, alpha, color, fill, linetype, size, weight

Graphical Primitives

c <- ggplot(map, aes(long, lat))

c + geom_polygon(aes(group = group)) x, y, alpha, color, fill, linetype, size

d <- ggplot(economics, aes(date, unemploy))

d + geom_path(lineend="butt", linejoin="round', linemitre=1) x, y, alpha, color, linetype, size

d + geom ribbon(aes(ymin=unemploy - 900, ymax=unemploy + 900) x, ymax, ymin, alpha, color, fill, linetype, size

e <- ggplot(seals, aes(x = long, y = lat))

e + geom segment(aes(

xend = long + delta_long, yend = lat + delta lat))

x, xend, y, yend, alpha, color, linetype, size

e + geom rect(aes(xmin = long, ymin = lat, xmax= long + delta_long, ymax = lat + delta lat)

xmax, xmin, ymax, ymin, alpha, color, fill, linetype, size

Two Variables

Continuous X, Continuous Y

f <- ggplot(mpg, aes(cty, hwy))

+ geom jitter()

f + geom blank()

x, y, alpha, color, fill, shape, size

+ geom point()

x, y, alpha, color, fill, shape, size

geom_quantile()

x, y, alpha, color, linetype, size, weight

geom_rug(sides = "bl") alpha, color, linetype, size

+ geom smooth(model = lm)

x, y, alpha, color, fill, linetype, size, weight

+ geom_text(aes(label = cty))

x, y, label, alpha, angle, color, family, fontface, hjust, lineheight, size, vjust

Discrete X, Continuous Y g <- ggplot(mpg, aes(class, hwy))

g + geom_bar(stat = "identity")

x, y, alpha, color, fill, linetype, size, weight

g + geom_boxplot()

lower, middle, upper, x, ymax, ymin, alpha, color, fill, linetype, shape, size, weight

g + geom_dotplot(binaxis = "y", stackdir = "center")

g + geom violin(scale = "area")

x, y, alpha, color, fill, linetype, size, weight

Discrete X, Discrete Y

h + geom jitter()

x, y, alpha, color, fill, shape, size

Continuous Bivariate Distribution

i <- ggplot(movies, aes(year, rating))

+ **geom bin2d(**binwidth = c(5, 0.5)**)** xmax, xmin, ymax, ymin, alpha, color, fill, linetype, size, weight

+ geom density2d()

x, y, alpha, colour, linetype, size

+ geom hex()

x, y, alpha, colour, fill size

Continuous Function

i <- ggplot(economics, aes(date, unemploy))</pre>

j + geom_area()

x, y, alpha, color, fill, linetype, size

j + geom_line() x, y, alpha, color, linetype, size

j + geom_step(direction = "hv") x, y, alpha, color, linetype, size

Visualizing error

df <- data.frame(grp = c("A", "B"), fit = 4:5, se = 1:2)k <- ggplot(df, aes(grp, fit, ymin = fit-se, ymax = fit+se))

k + geom_crossbar(fatten = 2)

x, y, ymax, ymin, alpha, color, fill, linetype,

k + geom_errorbar() x, ymax, ymin, alpha, color, linetype, size,

k + geom_pointrange()

x, y, ymin, ymax, alpha, color, fill, linetype, shape, size

data <- data.frame(murder = USArrests\$Murder, state = tolower(rownames(USArrests))) map <- map_data("state")</pre> l <- ggplot(data, aes(fill = murder))</pre>

+ geom_map(aes(map_id = state), map = map) + expand_limits(x = map\$long, y = map\$lat) map_id, alpha, color, fill, linetype, size

Three Variables

seals\$z <- with(seals, sqrt(delta long^2 + delta lat^2)) m <- ggplot(seals, aes(long, lat))

+ geom_contour(aes(z = z))

x, y, z, alpha, colour, linetype, size, weight

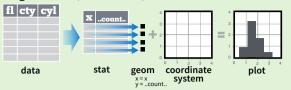

m + geom_raster(aes(fill = z), hjust=0.5, vjust=0.5, interpolate=FALSE) x, y, alpha, fill

m + geom_tile(aes(fill = z)**)** x, y, alpha, color, fill, linetype, size

Stats - An alternative way to build a layer

Some plots visualize a **transformation** of the original data set. Use a **stat** to choose a common transformation to visualize. e.g. a + geom_bar(stat = "bin")

Each stat creates additional variables to map aesthetics to. These variables use a common ..name.. syntax.

stat functions and geom functions both combine a stat with a geom to make a layer, i.e. stat_bin(geom="bar") does the same as **geom bar(stat="bin")**

layer specific variable created by transformation

1D distributions

+ stat_density2d(aes(fill = ..level..). geom = "polygon", n = 100)

geom for layer parameters for stat

a + stat_bin(binwidth = 1, origin = 10)

x, y | ..count.., ..ncount.., ..density.., ..ndensity.. a + stat_bindot(binwidth = 1, binaxis = "x")

x, y, | ..count.., ..ncount..

a + stat_density(adjust = 1, kernel = "gaussian") x, y, | ..count... ..density... ..scaled..

f + stat_bin2d(bins = 30, drop = TRUE) x, y, fill | ..count.., ..density..

f + stat binhex(bins = 30)

x, y, fill | ..count.., ..density..

f + stat_density2d(contour = TRUE, n = 100) x, y, color, size | ..level..

m + stat contour(aes(z = z))

x, y, z, order | ..level.

m+ stat_spoke(aes(radius= z, angle = z))

angle, radius, x, xend, y, yend | ..x.., ..xend.., ..y.., ..yend..

m + stat_summary_hex(aes(z = z), bins = 30, fun = mean)

x, y, z, fill | ..value..

m + stat_summary2d(aes(z = z), bins = 30, fun = mean)

x, y, z, fill | ..value..

g + stat boxplot(coef = 1.5)

x, y | ..lower.., ..middle.., ..upper.., ..outliers..

g + stat_ydensity(adjust = 1, kernel = "gaussian", scale = "area") x, y | ..density.., ..scaled.., ..count.., ..n.., ..violinwidth.., ..width..

f + stat ecdf(n = 40)

x, y | ..x.., ..y..

 $f + stat_quantile(quantiles = c(0.25, 0.5, 0.75), formula = y \sim log(x),$ method = "rg")

x, y | ..quantile.., ..x.., ..y..

 $f + stat_smooth(method = "auto", formula = y \sim x, se = TRUE, n = 80,$ fullrange = FALSE, level = 0.95)

x, y | ..se.., ..x.., ..y.., ..ymin.., ..ymax.

ggplot() + stat_function(aes(x = -3:3), fun = dnorm, n = 101, args = list(sd=0.5))

General Purpose

x | ..y..

f + stat identity()

ggplot() + stat_qq(aes(sample=1:100), distribution = qt, dparams = list(df=5))

sample, x, y | ..x.., ..y..

f + stat_sum()

x, y, size | ..size..

f + stat summary(fun.data = "mean cl boot")

f + stat_unique()

Scales

Scales control how a plot maps data values to the visual values of an aesthetic. To change the mapping, add a custom scale.

n <- b + geom_bar(aes(fill = fl))</pre> aesthetic prepackaged scale specific scale to use n + scale_fill_manual(values = c("skyblue", "royalblue", "blue", "navy"), limits = c("d", "e", "p", "r"), breaks =c("d", "e", "p", "r"), name = "fuel", labels = c("D", "E", "P", "R")) range of values to title to use in labels to use in breaks to use in legend/axis

General Purpose scales

Use with any aesthetic: alpha, color, fill, linetype, shape, size

scale_*_continuous() - map cont' values to visual values scale_*_discrete() - map discrete values to visual values scale_*_identity() - use data values as visual values scale_*_manual(values = c()) - map discrete values to manually chosen visual values

X and Y location scales

Use with x or y aesthetics (x shown here)

scale_x_date(labels = date_format("%m/%d"), breaks = date_breaks("2 weeks")) - treat x values as dates. See ?strptime for label formats.

scale_x_datetime() - treat x values as date times. Use same arguments as scale x date().

scale_x_log10() - Plot x on log10 scale

scale_x_reverse() - Reverse direction of x axis

scale x sqrt() - Plot x on square root scale

Color and fill scales

Discrete

Continuous

aes(fill = fl)) + scale_fill_brewer(palette = "Blues")

For palette choices: library(RcolorBrewer) display.brewer.all()

O

 \Diamond

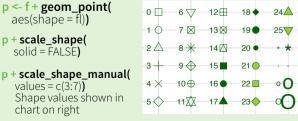

+ scale_fill_grey(start = 0.2, end = 0.8, na.value = "red")

topo.colors(), cm.colors(), RColorBrewer::brewer.pal()

Shape scales

Manual shape values

Size scales

Coordinate Systems

r <- b + geom bar()

r + coord cartesian(xlim = c(0, 5))xlim, ylim

The default cartesian coordinate system r + coord fixed(ratio = 1/2)

ratio, xlim, ylim Cartesian coordinates with fixed aspect ratio between x and y units

r + coord_flip()

xlim, ylim

Flipped Cartesian coordinates r + coord polar(theta = "x", direction=1)

theta, start, direction

Polar coordinates r + coord trans(ytrans = "sqrt")

xtrans, ytrans, limx, limy Transformed cartesian coordinates. Set extras and strains to the name of a window function.

z + coord map(projection = "ortho". orientation=c(41, -74, 0))

projection, orientation, xlim, ylim

Map projections from the mapproj package (mercator (default), azequalarea, lagrange, etc.)

Faceting

Facets divide a plot into subplots based on the values of one or more discrete variables.

t <- ggplot(mpg, aes(cty, hwy)) + geom point()

t + facet_grid(. ~ fl) facet into columns based on fl

t + facet_grid(year ~ .) facet into rows based on year

t + facet grid(year ~ fl) facet into both rows and columns

t + facet wrap(~ fl) wrap facets into a rectangular layout

Set **scales** to let axis limits vary across facets

t + facet_grid(y ~ x, scales = "free")

x and y axis limits adjust to individual facets

- "free x" x axis limits adjust
- "free_y" y axis limits adjust

Set labeller to adjust facet labels

t + ggtitle("New Plot Title")

t + xlab("New X label")

t + ylab("New Y label")

All of the above

Add a main title above the plot

Change the label on the X axis

Change the label on the Y axis

t + facet_grid(. ~ fl, labeller = label_both) fl: c fl: d fl: e fl: p t + facet_grid(. ~ fl, labeller = label_bquote(alpha ^ .(x))) $lpha^c$ $lpha^d$ $lpha^e$ $lpha^p$ $lpha^r$ t + facet grid(. ~ fl, labeller = label parsed) d

Labels

t + labs(title = "New title", x = "New x", y = "New y")

Use scale functions to update legend labels

Position Adjustments

Position adjustments determine how to arrange geoms that would otherwise occupy the same space.

s <- ggplot(mpg, aes(fl, fill = drv))

s + geom bar(position = "dodge") Arrange elements side by side

s + geom_bar(position = "fill") Stack elements on top of one another, normalize height

s + geom bar(position = "stack") Stack elements on top of one another

f + geom_point(position = "jitter") Add random noise to X and Y position of each element to avoid overplotting

Each position adjustment can be recast as a function with manual width and height arguments

s + geom_bar(position = position_dodge(width = 1))

Legends

t + theme(legend.position = "bottom") Place legend at "bottom", "top", "left", or "right"

t + guides(color = "none")

Set legend type for each aesthetic: colorbar, legend, or none (no legend)

t + scale fill discrete(name = "Title", labels = c("A", "B", "C"))

Set legend title and labels with a scale function.

Zooming

Themes

Grey background

(default theme)

theme_classic() White background no gridlines

theme_minimal() Minimal theme

ggthemes - Package with additional ggplot2 themes

Without clipping (preferred) t + coord cartesian(

With clipping (removes unseen data points)

xlim = c(0, 100), ylim = c(10, 20)

t + scale x continuous(limits = c(0, 100)) +scale_y_continuous(limits = c(0, 100))
